An estimated 90 percent of oncology patients in the United States receive treatment in outpatient cancer centers and clinics. This change from the older model of inpatient care has important implications for overall quality of care for oncology patients and nutritional care in particular. Amidst growing concern about access to oncology nutrition services, combined with growing recognition of the importance of providing nutritional care to optimize oncology treatment outcomes and maximize quality of life among both patients and survivors of cancer, the National Academies of Sciences, Engineering, and Medicine convened a public workshop in March 2016 to explore evolving interactions between nutritional care, cancer, and health outcomes. Participants explored how health outcomes and survival of cancer patients in outpatient cancer centers are affected by current standards for nutritional services, nutritional interventions, and benefits associated with oncology patient access to medical nutrition therapy. They also studied the

cost of outpatient nutritional care and assessed cost-benefit relationships between oncology nutrition services and health outcomes and survival. This publication summarizes the presentations and discussions from the workshop.

Communicating Nutrition

Nutrition, defined by Merriam-Webster, is the process of eating the right kind of food so you can grow properly and be healthy. However, making the right food and nutrition choices and finding the best and most accurate nutrition information can be a challenge, especially when a disease or injury is present. There are a wide range of ways that nutrition can be healing, from a simple broth that provides fluids and electrolytes to therapeutic nutrition for diabetes, irritable bowel syndrome, or osteoporosis. Registered Dietitian Nutritionists (RDN) have expertise

in disease management and translation of nutrition requirements to foods to consume. However, nutrition care often does not receive the attention in the outpatient setting that is needed to achieve nutrition goals. The purpose of this book is to provide pertinent and concise nutrition care information for Registered Dietitian Nutritionists and other professionals working with individuals outside of the hospital including nurses, pharmacists, and physicians. This book covers screening, assessing, and treating malnutrition; out-patient nutrition care in diabetes, cardiovascular disease, gastrointestinal disease, osteoporosis; and home enteral and parenteral nutrition. In each chapter the reader will learn more about the disease process as well as the management of the disease or therapy. As the number of patients receiving home care nutrition support increases, proper assessment and management of this therapy is crucial, and clinicians need to practice at an advanced level. This book presents advanced and readily applicable information on proper nutrition care of individuals in the outpatient setting and those receiving home nutrition support.
