High Risk Diabetic Foot

The second edition of An Atlas of Foot and Ankle Surgery builds on the success of the first, with an international selection of expert contributors to represent the current practice of foot and ankle surgery throughout the world. The material in this atlas is presented according to how foot and ankle pathology is encountered by most orthopaedic surgeons in their practice. Some chapters deal with individual common procedures, such as the soft tissue procedure for hallux valgus: in these, technical details and variations of technique are presented. Other chapters deal with diagnoses, such as metatarsalgia or cavus foot, and a number of different surgical treatment options are described. The scope of each chapter exceeds surgical instructions alone: the respective pathology is detailed, as are diagnostic techniques and alternative methods of treatment. The Atlas of Foot and Ankle Surgery should be of interest not only to inexperienced specialist surgeons, but also to the general orthopaedists and surgeon in training with an interest in disorders of the foot and ankle.

Vascular Surgery

Foot ulcers occur in approximately 15% of the patients with diabetes mellitus in their lifetime, with a major impact on their quality of life. Many hospital admissions related to diabetes are due to foot ulcers, which can result in prolonged hospital stay and increased morbidity and mortality. The majority of lower limb amputations are performed in patients with diabetes every year (80,000 at least in the USA). Most of the diabetes-related foot problems can be prevented or their severity reduced by early detection and treatment. This book contributes to improved foot care through raised awareness of prevention, clinical manifestations, diagnosis and management among healthcare professionals. This comprehensive atlas, now in a second edition, provides: 520 colour photographs, graphs, tables and imaging studies Educational examples taken from genuine case reports A reference guide for identifying patients at risk for foot problems Illustration of common problems such as neuropathic and neuroischaemic ulcers, ischaemia and infection Introduction to new technologies and bioengineered materials used for the treatment of foot ulcers This book will be of interest to diabetologists, endocrinologists, podiatrists, specialist nurses, general practitioners, surgeons and clinical researchers.

The Foot in Diabetes

This atlas fills a gap in the literature by documenting in detail the role of nuclear medicine imaging of infection and inflammation. The pathophysiologic and molecular mechanisms on which radionuclide imaging of infection/inflammation is based are clearly explained, but the prime focus of the book is on the clinical

relevance of such procedures. Their impact is demonstrated by a collection of richly illustrated teaching cases that describe the most commonly observed scintigraphic patterns, as well as anatomic variants and technical pitfalls. Due attention is paid to the application of recently developed techniques, including multimodality fusion imaging such as SPECT/CT and PET/CT. Emphasis is placed in particular on the ability of multimodality imaging to increase both the sensitivity and the specificity of radionuclide imaging. This atlas will be an excellent learning tool for residents in nuclear medicine and illuminating for other specialists with an interest in the field.

Atlas Foot and Ankle Surgery, Second Edition

Surgical Reconstruction of the Diabetic Foot and Ankle

Diabetes mellitus affects approximately 20 million people in the US, or nearly 7% of the population. It is expected to increase by 70% within the next 25 years, and numerous epidemiologic studies have demonstrated that type 2 diabetes increases the risk of cardiovascular morbidity and mortality. It is estimated to cost over \$92 billion in health care costs and lost productivity. The increased risk is due to the detrimental vascular effects of prolonged exposure to a hyperglycemic, oxidant-rich environment yielding associated cardiovascular risk factors: atherosclerosis, hypertension and clotting abnormalities. Hypertension and dyslipidemia in diabetic patients produces substantial decreases in cardiovascular and microvascular diseases. Nutritional and Therapeutic Interventions for Diabetes and Metabolic Syndrome provides an overview of the current epidemic, outlines the consequences of this crisis and lays out strategies to forestall and prevent diabetes, obesity and other intricate issues of metabolic syndrome. The contributing experts from around the world give this book relevant and up-to-date global approaches to the critical consequences of metabolic syndrome and make it an important reference for those working with the treatment, evaluation or public health planning for the effects of metabolic syndrome and diabetes. Scientific discussion of the epidemiology and pathophysiology of the relationship between diabetes and metabolic syndrome Includes coverage of Pre-diabetes conditions plus both Type I and Type II Diabetes Presents both prevention and treatment options
