The discovery of insulin at the University of Toronto in 1921-22 was one of the most dramatic events in the history of the treatment of disease. Insulin was a wonder-drug with ability to bring patients back from the very brink of death, and it was no surprise that in 1923 the Nobel Prize for Medicine was awarded to its discoverers, the Canadian research team of Banting, Best, Collip, and Macleod. In this engaging and award-winning account, historian Michael Bliss recounts the fascinating story behind the discovery of insulin - a story as much filled with fiery confrontation and intense competition as medical dedication and scientific genius. For health-conscious pet owners, a natural, holistic guide to getting every canine back to his best, most primal state From the tiniest teacup poodle to the most massive Great Dane, dogs' digestive systems are pure wolf. Fido's ancestors enjoyed a diet that was 45–50 percent protein, 40–50 percent fat, and less than 10 percent carbohydrates. Walk down the pet food aisle, however, and you'll find that typical commercial kibble is made mainly of starchy ingredients like peas, potatoes, corn, wheat, rice, and oats—nothing a prehistoric pup would dream of eating. This "healthy" mix is proving anything but: About 85 percent of dogs eat commercial dog food, and at least half of them are overweight or obese, with cancer killing 42 percent of all dogs and half of dogs over the age of 10. So how do you feed a wolf

Cats, through desert adaptation, require water as a component of their food. They also lack the metabolic pathways to efficiently process plant material, thus defining them as obligate carnivores; their food should consist only of meat, fat, bones, and organs. These are two very simple yet fundamental facts of feline nutrition. A cat is solely designed to hunt, kill, eat, and process meat. Through millions of years of evolution, cats have developed unique characteristics of anatomy, physiology, metabolism, and behavior indicative of obligate carnivores. Many feline diseases such as diabetes, obesity, urinary tract disorders, chronic renal disease, and irritable bowel syndrome can be directly attributed to low moisture, low-meat-protein, and high-carbohydrate levels that plague many of today's commercially produced cat foods. Many cats survive on these dry, supplemented, plant-based diets but they do not thrive. This book will discuss basic feline anatomy and physiology (explaining how a cat's body metabolizes nutrients) coupled with interpreting pet food labels which will
