This book examines the long term economic growth that has raised the West's material living standards to levels undreamed of by counterparts in any previous time or place. The authors argue that this growth has been driven by technological revolutions that have periodically transformed the West's economic, social and political landscape over the last 10,000 years and allowed the West to become, until recently, the world's only dominant technological force. Unique in the diversity of the analytical techniques used, the book begins with a discussion of the causes and consequences of economic growth and technological change. The authors argue that long term economic growth is largely driven by pervasive technologies now known as General Purpose (GPTs). They establish an alternative to the standard growth models that use an aggregate production function and then introduce the concept of GPTs, complete with a study of how these technologies have transformed the West since the Neolithic Agricultural Revolution. Early modern science is given more importance than in most other treatments and the 19th century demographic revolution is studied with a combination of formal models of population dynamics and historical analysis. The authors argue that once sustained growth was established in the West, formal models can shed much light on its subsequent behaviour. They build non-conventional, dynamic, non-stationary equilibrium models of GPT-driven growth that incorporate a range of phenomena that their historical studies show to be important but which are excluded from other GPT models in the interests of analytical tractability. The book concludes with a study of the policy implications that follow from their unique approach.

Microeconomics, Growth and Political Economy is the first of two volumes which collect together many of Professor Lipsey's writings on economics, some of which are previously unpublished or currently inaccessible. This book contains papers on economic growth and technical change, monetary and value theory, the theory of second best, international trade theory, political economy and methodology. A separate book, On the Foundations of Monopolistic Competition and Economic Geography, contains works on oligopoly and location theory, all coauthored with Curtis Eaton. The book begins with a new autobiographical introduction to the intellectual development, personal achievements and the fields of interest of Richard G. Lipsey and is divided into five parts. The first part considers various aspects of economic growth and technical change taking into account the structuralist view, markets and the globalization of the economy. Part two is concerned with the microeconomic issues of second-best theory and monetary and value theory. The third part looks at trade theory and surveys customs unions and competitiveness. Political economy is considered in the fourth part, which contains essays on topics such as the balance of payments, the survival of the market economy, international liquidity theory and American trade policy. The final part features papers on methodology. Microeconomics, Growth and Political Economy is an essential reference companion to the work of Richard G. Lipsey, one of the most important economists of our generation.

This book by Lionel Robbins first appeared in 1932 as an outstanding English-language statement of the Misesian view of economic method, namely that economics is a social science and must advance its propositions by means of deductive reasoning and not through the methods used in the natural sciences. The case is argued here with patience and attention to scholarly details. The unfortunate second edition of this book, which is more available today, introduces confusions by departing from Austrian microeconomic theory. Thus does the Mises Institute celebrate the 75th anniversary of the first edition with this reprint. "Reading Robbins," writes Samuel Bostaph of the University of Dallas, "is an excellent way of contrasting his explanation of the basic nature of economics with that of the Austrian School, as found in the work of Mises as an extension of Carl Mengers's foundations. Such a reading wonderfully clarifies one's understanding of the basic conception of economics as a science of human action, rather than one of mere 'economizing.' "

Instructor's manual to accompany Lipsey, Courant, Purvis Economics, eighth Canadian edition

An introductory textbook based on the premises that economics is a science, is useful in everyday life, and is sometimes difficult but never impossible to learn. The latest edition accounts for the globalization of the economy, the triumph of market capitalism, and the declining growth of market economies. Mathematics beyond the most elementary is confined to an appendix. A teacher's manual, test banks, and supporting software for both teachers and students are available. Positive Economics for Australian Students

The 16 essays were presented in September 1994 at Simon Fraser University where economist Lipsey teaches. They contribute to some of the areas that he has worked in, including the theory of second best; unemployment, inflation, and the Phillips Curve; trade theory, customs unions, and the growth of the global economy; strategic behavior in an exchange economy, competition, and strategic choice of technology to support collusive oligopoly equilibria, property rights, and technology; and teaching economics, transforming institutions, and the professional economist. This work maintains the approach of the US text, Principles of Economics by Case and Fair, but with the main focus on Europe. This is reflected in the use of the open economy approach, the use of the Euro as the standard currency, as well as providing numerous European examples and applications. Maths Boxes enable the lecturer to decide on the amount of calculus they wish to include. End-of-chapter problems with selected answers at the end of the book allow students to assess their progress.

B. Curtis Eaton is one of Canada's leading microeconomists. As an applied economic theorist, Eaton has contributed greatly to industrial organization literature and has also worked in labour economics, economic geography, and organizational theory. The essays in this volume, by former students and present and former colleagues, call attention to the path-breaking work of Professor Eaton. The first two chapters provide a short overview of Eaton's research contributions and argue that his work laid the foundation for important research programs across the country. The remaining chapters, including an unpublished paper by Eaton himself, consist of original work that can be divided into the three broad categories of industrial organization and spatial competition, trade and productivity, and social interaction. Not only a collection of laudatory essays, *Industrial Organization, Trade, and Social Interaction* presents cutting edge research by leading scholars.

Economics

An Introduction to Positive Economics

Traditional economics treats the defining subjective properties of economic agents (tastes, preferences, demands, goals and perceptions) as if they are determined independently of individual and collective relations with other agents. This collection of essays reflects the increasingly common view that economics cannot continue to disregard all economic phenomena inconsistent with this conception. The volume is especially concerned with the idea of intersubjective influences on market outcomes. A team of expert international contributors have been brought together to address the question of intersubjectivity from a variety of perspectives. Using methods of description and analysis they explore the structures and effects of concrete interdependencies between individual subjectivities engaged in economic activity, and develop conceptual and analytical tools for this task. Many of the essays are interdisciplinary in scope and in addition to economics the book should provide valuable lessons in psychology, sociology, social theory, philosophy, political science and history.
