Introduction to Organic Laboratory Techniques

Organic Spectroscopy

This introductory textbook covers all the major spectroscopic techniques that cover the derivation of structural information from spectroscopic data. It incorporates over 200 carefully selected problems that are graded to develop and consolidate the students understanding of organic spectroscopy and to develop an understanding of how structures are derived. This, the third edition has been thoroughly revised and updated and reflects the many developments in this area. It includes over 50 new problems and presents challenging examples that have been carefully selected to include all-important structural features and to emphasise connectivity arguments. More emphasis on techniques is included in the problems and the advanced NMR topics section is expanded in the areas of decoupling and applications of the nuclear overhauser effect (nOe). Brief and easy-to-read text providing sufficient detail of theory to be able to solve problems without going

to excessive depth. Large, graded selection of problems—from the very easy to challenging. Provides hands-on training for the non-expert

Spectroscopy

The derivation of structural information from spectroscopic data is now an integral part of organic chemistry courses at all Universities. A critical part of any such course is a suitable set of problems to develop the student's understanding of how structures are determined from spectra. Organic Structures from Spectra, Fifth Edition is a carefully chosen set of more than 280 structural problems employing the major modern spectroscopic techniques, a selection of 27 problems using 2D-NMR spectroscopy, more than 20 problems specifically dealing with the interpretation of spin-spin coupling in proton NMR spectra and 8 problems based on the quantitative analysis of mixtures using proton and carbon NMR spectroscopy. All of the problems are graded to develop and consolidate the student's understanding of organic spectroscopy. The accompanying text is descriptive and only explains the underlying theory at a level which is sufficient to tackle the problems. The text includes condensed tables of characteristic spectral properties covering the frequently encountered functional groups. The examples themselves have been selected to include all important common structural features found in organic compounds and to emphasise connectivity arguments. Many of the compounds were synthesised specifically for this purpose. There are many more

easy problems, to build confidence and demonstrate basic principles, than in other collections. The fifth edition of this popular textbook:

- includes more than 250 new spectra and more than 25 completely new problems;
- now incorporates an expanded suite of new problems dealing with the analysis of 2D NMR spectra (COSY, C H Correlation spectroscopy, HMBC, NOESY and TOCSY);
- has been expanded and updated to reflect the new developments in NMR and to retire older techniques that are no longer in common use;
- provides a set of problems dealing specifically with the quantitative analysis of mixtures using NMR spectroscopy;
- features proton NMR spectra obtained at 200, 400 and 600 MHz and ¹³C NMR spectra include DEPT experiments as well as proton-coupled experiments;
- contains 6 problems in the style of the experimental section of a research paper and two examples of fully worked solutions.

Organic Structures from Spectra, Fifth Edition will prove invaluable for students of Chemistry, Pharmacy and Biochemistry taking a first course in Organic Chemistry. Contents Preface Introduction Ultraviolet Spectroscopy Infrared Spectroscopy Mass Spectrometry Nuclear Magnetic Resonance Spectroscopy 2DNMR Problems Index Reviews from earlier editions “Your book is becoming one of the “go to” books for teaching structure determination here in the States. Great work!” “...I would definitely state that this book is the most useful aid to basic organic spectroscopy teaching in existence and I would strongly recommend every instructor in this area to use it either as a source of examples or as a class textbook”. Magnetic Resonance in Chemistry “Over the past year I have trained many students using

problems in your book - they initially find it as a task. But after doing 3-4 problems with all their brains activities working out the rest of the problems become a mania. They get addicted to the problem solving and every time they solve a problem by themselves, their confident level also increases." "I am teaching the fundamentals of Molecular Spectroscopy and your books represent excellent sources of spectroscopic problems for students."

Techniques in Organic Chemistry

Intended for advanced readers, this is a review of all relevant techniques for structure analysis in one handy volume. As such, it provides the latest knowledge on spectroscopic and related techniques for chemical structure analysis, such as NMR, optical spectroscopy, mass spectrometry and X-ray crystallography, including the scope and limitation of each method. As a result, readers not only become acquainted with the techniques, but also the advantages of the synergy between them. This enables them to choose the correct analytical method for each problem, saving both time and resources. Special emphasis is placed on NMR and its application to absolute configuration determination and the analysis of molecular interactions. Adopting a practical point of view, the author team from academia and industry guarantees both solid methodology and applications essential for structure determination, equipping experts as well as newcomers with the tools to solve any structural problem.

Spectrometric Identification of Organic Compounds

UV-VIS spectroscopy is one of the oldest methods in molecular spectroscopy. The definitive formulation of the Bouguer-Lambert Beer law in 1852 created the basis for the quantitative evaluation of absorption measurements at an early date. This led firstly to colorimetry, then to photometry and finally to spectrophotometry. This evolution ran parallel with the development of detectors for measuring light intensities, i.e. from the human eye via the photo element and photocell, to the photomultiplier and from the photographic plate to the present silicon-diode detector both of which allow simultaneous measurement of the complete spectrum. With the development of quantum chemistry, increasing attention was paid to the correlation between light absorption and the structure of matter with the result that in recent decades a number of excellent discussions of the theory of electronic spectroscopy

(UV-VIS and luminescence spectroscopy) have been published. Consequently, this extremely interesting aspect of molecular spectroscopy has dominated the teaching of the subject both in my own lectures and those of others. However, it is often overlooked that, in addition to the theory, applications of spectroscopic methods are of particular interest to scientists. For this reason, a lecture series about electronic spectroscopy given in the Institute for Physical Chemistry at the Heinrich-Heine-University in Dusseldorf was supplemented by one about "UV-VIS spectroscopy and its applications". This formed the basis of the present book.
