One morning in 1969, out of the blue, I received a letter which both distressed and astonished me. It was from a Prof. S. R. Das in Calcutta, who requested me to accept, for eventual analysis, a mountain of anthropometric data he had accumulated, as he was ill and did not expect to survive to analyse it himself. The data provided the astonishment; twenty-two anthropometric characters recorded every six months or a year, over a period of 14 years, in a mixed longitudinal study of some 560 children, aged six months to twenty years. Most were in families with siblings also in the study, and every child was measured every time by S. R. Das himself. The archive was unique, combining the personal anthropometry of R. H. Whitehouse in the Harpenden Growth Study and the family approach of the Fels

This was a study of which neither I, nor anyone of my acquaintance, had heard. Even in India, Prof. Das' work was scarcely known. It turned out Das was a scholarly man, quiet and unassuming, absolutely committed to his Sarsuna-Barisha Growth Study, just the obverse of the professional showman. Clearly this was not a request I could refuse, although I already had in hand enough projects to occupy Siva himself.

Genetic Resources for Climate Change Adaptive Traits focuses on practical means and approaches to further the use of genetic resources for mitigating the effects of climate change and improving crop production.

Genetic diversity in crop plants is being further explored to increase yield, disease resistance, and nutritional value by employing recent advances in mathematics and omics technologies to promote the adaptation of crops to changing climatic conditions.

This book presents a broad view of biodiversity and genetic resources in agriculture and provides answers to some current problems. It also highlights ways to provide much-needed information to practitioners and innovators engaged in addressing the effects of global climate change on agriculture. The book is divided into sections that cover: The implications of climate change for drylands and farming communities The potential of genetic resources and biodiversity to adapt to and mitigate climate change effects

Applications of mathematics and omics technologies Genomics and gene identification We are in the midst of significant changes in global climates, and its effects are already being felt throughout the world.

The increasing frequency of droughts and heat waves has had negative impacts on agricultural production, especially in the drylands of the world. This book shares the collective knowledge of leading scientists and practitioners, giving readers a broader appreciation and heightened awareness of the stakes involved in improving and sustaining agricultural production systems in the face of climate change.

This collection of articles is written by psychologists and pedagogues from two countries: the contributors from Norway work in the field of sport science at the Finnmark University College in Alta, while those from Poland are psychologists, pedagogues, and sociologists conducting their research in varied fields at the Pomeranian University in Slupsk. The common feature is that all of these scholars are interested in the same field of research: motivation. Therefore, this book examines the issue of motivation from various angles and different approaches. At the same time, the articles also provide insight into the similarities and differences that are specific to given countries. (Series: Psychologie - Vol. 52)

American Rage argues that anger is the central emotion governing contemporary US politics, with powerful, deleterious effects. Tracing the developments that have given rise to a culture of anger in the mass public, the book sheds new light on both public opinion and voting behavior. Steven W. Webster skillfully uses a combination of novel datasets, new measures of anger, and a series of experiments to show how anger causes citizens to lose trust in the national government and weaken in their commitment to democratic norms and values. Despite these negative consequences, political elites strategically seek to elicit anger among their supporters. Presenting compelling evidence, Webster ultimately concludes that elites engage in this behavior because voter anger leads to voter loyalty. When voters are angry, they are more likely to vote
