Principles of Assessment and Outcome Measurement for Occupational Therapists and Physiotherapists

We start life with a breath, and the process continues automatically for the rest of our lives. Because breathing continues on its own, without our awareness, it does not necessarily mean that it is always functioning for optimum mental and physical health. The opposite is true often. The problem with breathing is that it seems so easy and natural that we rarely give it a second thought. We breathe: we inhale, we exhale. What could be simpler? But behind that simple act lies a process that affects us profoundly. It affects the way we think and feel, the quality of what we create, and how we function in our daily life. Breathing affects our psychological and physiological states, while our psychological states affect the pattern of our breathing. For example, when anxious, we tend to hold our breath and speak at the end of inspiration in a high-pitched voice. Depressed people tend to sigh and speak at the end of expiration in a low-toned voice. A child having a temper tantrum holds his or her breath until blue in the face. Hyperventilation causes not only anxiety

but also such a variety of symptoms that patients can go from one specialty department to another until a wise clinician spots the abnormal breathing pattern and the patient is successfully trained to shift from maladaptive to normal breathing behavior.

Chapters are authored by experts in each disorder with GP input, putting a strong focus on diagnosis and easy-to-follow processes for deciding courses of action and investigation. Each section explores the range of treatment options for that topic, including step-by-step injection techniques where relevant, and signposts need-to-know areas with 'red flags'. This is an important reach-for guide to assist GPs with easy diagnosis and to provide clear direction on next recommended steps. It will also be useful for medical students taking orthopaedics modules.
